DETAILED ACTION

1. Applicant's amendment and accompanying remarks filed February 2, 2007 are acknowledged.

- 2. Examiner acknowledges amended claims 8, 11, 15, 17, 20-22, 24 and 28-29.
- 3. Examiner acknowledges newly added claims 36-39.

Claim Rejections - 35 USC § 112

- 4. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 5. Claim 15 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 15 is rendered indefinite because it is unclear as whether the claim is drawn to the process for producing an electroluminescent device or the preparation of an illumination poster or signage. There are two different inventions recited in claim 15.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 7. Claim 15 is rejected under 35 U.S.C. 102(b) as being anticipated by Van Haare et al., U.S. Patent Number 5,994,496.

Art Unit: 1774

Van Haare discloses layers of conjugated polymers that may be used as a transparent coating on a display device or as an electrode layer in an electroluminescent device (see column 1, lines 5-12). The reference discloses 3,4-di(2-mehtylbutoxy)-2,5-thiophene as a preferred polymer (see column 3, lines 22-31). Column 5, lines 27-37 of the Van Haare reference discloses that at least one electrode (which can include both electrodes) has a transparent coating using a preferred polythiophene such as 3,4-di(2-methylbutoxy)-2,5-thiophene solution. Exemplary embodiment 4 discloses a 3,4-dialkoxythiophene wherein the two alkoxy groups are represented by OR¹ and OR² wherein R¹ and R² are C1-C4 alkyl (butoxy) with a methyl group as a substituent on the alkyl chain. Although the

Claims 8-14, 17, 20-29 and 32-39 are allowed. The prior art does not provide for a process for producing an electroluminescent device comprising a transparent or translucent support, a transparent or translucent first electrode, a second conductive electrode and an electroluminescent phosphor layer sandwiched between said transparent or translucent first electrode and second conductive electrode, wherein said first and second electrodes each comprises a polymer or copolymer of 3,4-dialkoxythiophene, which may be the same or different, in which said two alkoxy groups may be the same or different or together represent an optionally substituted oxy-alkylene-oxy bridge, comprising the steps of: (I) coating a transparent or translucent support with a solution, a dispersion or a paste of a polymer or copolymer of a 3,4-dialkoxythiophene to produce said transparent or translucent first conductive layer; (ii) coating said first conductive layer with a layer comprising an electroluminescent phosphor, (iii) coating said layer comprising an electroluminescent phosphor with a dielectric layer; and (iv) coating said dielectric layer with a solution, dispersion or paste comprising a polymer or copolymer of

Application/Control Number: 10/614,148

Art Unit: 1774

3,4-dialkoxythiophene to produce said second conductive layer, wherein said polymer or copolymer of said 3,4-dialkoxythiophene in the solution, dispersion or pasted used in step (i) may be the same or different from said polymer or copolymer of said 3, 4-dialkoxythiophene used in the solution, dispersion or paste used in step (iv).

Additionally, the prior art does not provide for a process comprising the steps of: using a transparent paste comprising a polymer or copolymer of a 3,4-dialkoxythiophene, a polyacrylate thickener and a glycol derivative, and optionally a surfactant for producing an electrode of an electroluminescent device comprising a transparent or translucent support, a transparent or translucent first electrode, a second conductive electrode and an electroluminescent phosphor layer sandwiched between said transparent or translucent first electrode and said second conductive electrode, wherein said first and second electrodes each comprises a polymer or copolymer of a 3,4-dialkoxythiophene, which may be the same or different, in which said two alkoxy groups may be the same or different or together represent an optionally substituted oxyalkylene-oxy-bridge.

The prior art does not provide for a process for producing an electroluminescent device comprising a transparent or translucent support, a transparent or translucent first electrode, a second conductive electrode and an electroluminescent phosphor layer sandwiched between said transparent or translucent first electrode and second conductive electrode, wherein said first and second electrodes each comprises a polymer or copolymer of 3,4-dialkoxythiophene, which may be the same or different, in which said two alkoxy groups may be the same or different or together represent an optionally substituted oxy-alkylene-oxy bridge, comprising the steps of: (I) coating a transparent or translucent support with a solution, a dispersion or a paste of a polymer

Art Unit: 1774

or copolymer of a 3,4-dialkoxythiophene to produce said transparent or translucent first conductive layer; (ii) coating said first conductive layer with a layer comprising an electroluminescent phosphor, (iii) coating said layer comprising an electroluminescent phosphor with a dielectric layer; and (iv) coating said dielectric layer with a solution, dispersion or paste comprising a polymer or copolymer of 3,4-dialkoxythiophene to produce said second conductive layer, wherein said polymer or copolymer of said 3,4-dialkoxythiophene in the solution, dispersion or pasted used in step (i) may be the same or different from said polymer or copolymer of said 3, 4-dialkoxythiophene used in the solution, dispersion or paste used in step (iv) and wherein said electroluminescent phosphor belongs to the class of II-IV semiconductiors or is a combination of a group II element with an oxidic anion.

The prior art does not provide for a process for producing an electroluminescent device comprising a transparent or translucent support, a transparent or translucent first electrode, a second conductive electrode and an electroluminescent phosphor layer sandwiched between said transparent or translucent first electrode and second conductive electrode, wherein said first and second electrodes each comprises a polymer or copolymer of 3,4-dialkoxythiophene, which may be the same or different, in which said two alkoxy groups may be the same or different or together represent an optionally substituted oxy-alkylene-oxy bridge, comprising the steps of: (I) coating a transparent or translucent support with a solution, a dispersion or a paste of a polymer or copolymer of a 3,4-dialkoxythiophene to produce said transparent or translucent first conductive layer; (ii) coating said first conductive layer with a layer comprising an electroluminescent phosphor, (iii) coating said layer comprising an electroluminescent phosphor with a dielectric layer; and (iv) coating said dielectric layer with a solution, dispersion or paste

Application/Control Number: 10/614,148 Page 6

Art Unit: 1774

comprising a polymer or copolymer of 3,4-dialkoxythiophene to produce said second conductive layer, wherein said polymer or copolymer of said 3,4-dialkoxythiophene in the solution, dispersion or pasted used in step (i) may be the same or different from said polymer or copolymer of said 3, 4-dialkoxythiophene used in the solution, dispersion or paste used in step (iv) and wherein at least one of said two electrodes further comprises a polyanion compound.

Response to Arguments

- 8. Applicant's arguments filed February 2, 2007 have been fully considered but they are not persuasive. Applicant argues that amended claim 15 recites a process for producing an electroluminescent device and **further** describes a process for providing an illuminated poster or signage. Present claim 15 recites two different inventions. Amended claim 15 had originally been directed to a process for producing an electroluminescent device. Since applicant has received an action on the merits for the originally presented invention, this invention has been constructively elected by original presentation for prosecution on the merits. Additionally, van Haare reads on present claim 15 drawn to a process for producing an electroluminescence device in that OR¹ and OR² wherein R¹ and R² represents a C1-C4 alkyl group. The reference discloses that R¹ and R² are butoxy with a methyl group as a substituent on the alkyl chain. The rejection of claim 15 is maintained.
- 9. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

1

Application/Control Number: 10/614,148 Page 7

Art Unit: 1774

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communication from the examiner should be directed to Camie S. Thompson whose telephone number is (571) 272-1530. The examiner can normally be reached on Monday through Friday from 7:30 am to 4:00 pm. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rena L Dye, can be reached at (571) 272-3186. The fax phone number for the Group is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
